ALL Torsion bar fitted models

These instructions are intended as supplementary to the workshop manual, not a substitute for it. If you are unsure if you have the necessary skills and competence, please professional seek advice.

Pedders torsion bars come with marking that show which is left and right as well as direction of operation arrows.

The diagram below shows how these should be fitted. This shows the bars as viewed as though you were standing behind the vehicle looking towards the front.

It will often be necessary to adjust the installed height of the torsion bars after fitment to ensure the vehicle sits correctly. This should be done using the adjustment mechanism provided by the manufacturer. This is normally at the rear of the bar.

If significant changes in height are made, it is essential that an alignment check is carried out.
